Investigations of concretes with slag-cement binder. A.
 STRONON. *Bull. Etudes et recherches tech. (Romania)*, 1, 1969-07
 (1949) (in French).—Granulated basic blast-furnace slags have
 hydraulic properties but set very slowly. To accelerate setting,
 additions of cement, lime, gypsum, salts of sodium, and calcium
 chloride are made so that the slags can be utilized as cement to
 replace Portland cement. Comparative tests were made of dif-
 ferent mixtures with slag and pure cement. The amount of water
 required for a given consistency increases with the amount of
 sand in the aggregate used, irrespective of the binder (pure
 cement or cement with 30% slag). The bulk density of the
 fresh concrete decreases, the mechanical strength is reduced, and
 shrinkage increases with increasing sand content; these effects
 are more pronounced in concretes with slag cement. The in-
 creasing water:cement ratio has practically no detrimental
 effect on the technical properties of the pure cement concretes;
 instead they are improved in mixtures richer in sand. Slag-
 cement concretes show a slight decrease in strength. Shrinkage
 is almost always greater in concrete with slag cement, especially
 in plastic mixtures.

TITLE: Adsorption Blocks for the Drying of Air (Bloki adsorbtsionnoy osushki vozdukha)

PERIODICAL: Kislород, 1957, Nr 6, pp. 25-25 (USSR)
Received: April 7, 1958

ABSTRACT: In this paper a new construction of adsorption blocks for the drying of air at high pressure is recommended. The blocks are produced in two types according to their range of efficiency:
1.) For the drying of 15 and 30 m³ p.h. of compressed air at a pressure of 220 at. Its efficiency is 15 nm³/h at (1 at.) to 3300 nm³ (at 220 at.). The second type of blocks is intended for an efficiency of 30-6600 nm³/h. For the heating of the nitrogen which is used for regeneration of the sorbents, heaters of the type 3T are used. Automatic control of the electric heaters is brought about by means of the electrocontact thermometers "ЭКТ-1" and "ЭКТ-2", which are produced by the "Manometr" works. In order to avoid a burning through of the electric heaters when switching off the current of nitrogen, a safety device is provided in the diaphragm of the nitrogen feed which, in a case of emergency,

ABSTRACT: The BR-IM assembly, which can produce samples of commercially and technologically pure oxygen (99.5%), pure nitrogen (0.02% O₂) or krypton-xenon concentrate from dry, CO₂-free air, differs from earlier models in the outfitting of the auxiliary tank. These and other differences are minutely described by tabular data and scale drawings. The CO₂ crystals left are removed by 280 metallo-ceramic filter-adsorbers. The machine and more critical inner portions have double-walled, insulating housings of steel 3. Piping between various enclosed sections is of insulated metal. Stress points are doubly reinforced. Controls are implemented by

AUTHOR: Hřetislav Doležel and Jiří Štěpek

TITLE: Contribution to the Thermal and Optical Breakdown of
Polyvinyl Chloride and its Co-Polymers

PERIODICAL: Chemický Průmysl, 1960, Nr 7, pp 381-386

ABSTRACT: The authors present a study of the effect of heat, light and gaseous medium upon the breakdown of polyvinyl chloride and its co-polymers with vinylidene chloride and vinyl acetate, respectively. The degradation of the polymers is accompanied by a splitting off of hydrochloric acid, discolouration, fission of the macromolecules and their cross linkings. The mechanism and the ensuing effects of thermal and optical degradations are different. The initial stages of the thermal breakdown of polyvinyl chloride have not yet been fully elucidated. It has been established that it is accelerated by oxygen and polymerization catalysts. The question whether the split off HCl acts as autocatalyst, has not yet been answered satisfactorily. The thermal degradation causes an intense discolouration but very little change of mechanical properties. The photochemical degradation, on the other hand, reduces the strength and

Contribution to the Thermal and Optical Breakdown of Polyvinyl Chloride and its Co-Polymers

flexibility and increases brittleness. The main process taking place during photochemical breakdown is an oxidation, the primary step of which is the splitting off of hydrochloric acid. The authors point out that on thermodynamic considerations, light of a wavelength of 2200 to 2300 Å has sufficient energy for the fission of the C-Cl and C-H bonds. The presence of carbonyl groups or other structural irregularities will shift the absorption to the visible part of the spectrum and thus accelerate photochemical breakdown of polyvinyl chloride. The authors practical and experimental contributions to the study of the problem were as follows: The thermal and photochemical degradation of emulsion and suspension-polymerized vinyl chloride and its co-polymers with vinylidene chloride 90/10 and the co-polymer with vinyl acetate 87/13 in oxygen, ozone and nitrogen, were followed and compared experimentally. A: The thermal destruction was studied by following the course of splitting off of HCl, by determining the amount of

Card 2/5

Z/009/60/000/07/038/040
E112/E453

Contribution to the Thermal and Optical Breakdown of Polyvinyl Chloride and its Co-Polymers

insoluble compounds formed during the degradation, by measuring the change of viscosity and index of swelling. B: The photochemical degradation was measured on foils of the polymers placed in quartz tubes and irradiated^v with ultra violet light. The split-off HCl was absorbed in a caustic soda solution and determined by potentiometric titration with silver nitrate. Procedure for the different determinations are given in details. The following results are given: A linear relationship exists between the amounts of split-off HCl from polyvinyl chloride and its co-polymers in an atmosphere of nitrogen, oxygen and ozone. In an atmosphere of oxygen and ozone, the breakdown of polyvinyl chloride is more rapid than under nitrogen. Suspension polyvinyl chloride is more liable to thermal breakdown than the emulsion-polymer. The speed of breakdown by heat of the co-polymers of vinyl chloride with vinylidene chloride is eighteen times greater than that of polyvinyl chloride. However, the breakdown of

Card 3/5

Z. 1/50/000/07/036/040
E112/E453

Contribution to the Thermal and Optical Breakdown of Polyvinyl Chloride and its Co-Polymers

the co-polymer of vinylchloride with vinyl acetate is considerably smaller and approaches that of the suspension-polyvinyl chloride. The speed of formation of insoluble fractions in an atmosphere of nitrogen is greater in the case of vinyl chloride-vinylidene chloride than of pure polyvinyl chloride. The relationship between amount of split-off hydrochloric acid and time of irradiation with ultraviolet light was found to be linear with all tested polymers. The resistance to photochemical degradation decreases in the order: Polyvinyl chloride, co-polymer from vinyl chloride and vinylidene chloride. The discolouration of the resins by ultra violet light is slower than during a thermal breakdown and is masked by the oxidation of conjugated double bonds, which in its turn leads to a discolouration. There are 11 figures and 17 references, 11 of which are English, 1 Czech, 3 Soviet and 2 German.

Orig Pub : Zbl. Neurochirurg., 1957, 17, No 6, 378-385

Abstract : The contents of 11 cysts of brain and spinal cord tumors were studied with the aid of various chemical methods, electrophoresis on paper, spectrography and chromatography. In infratentorial cysts of the cerebellum, the coefficient A/G 2, in supratentorial 2. The lowest content of sterol esters coincided with that of N. In 3 cysts the content of Bi, Ba and Al was increases; in individual cases glucosamine (4 times), glucose (3 times), pentose (4 times) and maltose (1 time) were discovered. There is no relation between the chemical composition of

The evaluation of the antiseptic action of glycerol solutions with biochemical methods. Jan Štěpán (Charles Univ., Prague, Czech.). *Casopis Českého Lékařnictva* 63, 1-14 (1950).—Fluorescence in the ultraviolet region is considered an important mark of glycerol antiseptic efficiency. Of 11 samples, 10 showing fluorescence had lower antiseptic action than 1 without fluorescence. However, the amt. of fluorescence could not be correlated absolutely with disinfectant action owing largely to errors by color interference. The sample without fluorescence contained no NH₄ compds. and was lower in titrable acidity and glycerol ester content than the fluorescent samples. Fluorescence may be due to various NH₄ salts, aldehydes, esters, or to other undetd. impurities.

Naunyn-Schmiedeberg's Arch. exp. Pathol. Pharmacol. 226,
328-34 (1965).—The polyhydrate of choline nicotinate gives
the added effects of its components. The chloride of nico-
tinoylcholine and its HCl salt cause in rabbits and cats
changes in the blood pressure which depend on the dosage.
Moderate doses (4 mg.) cause a drop in blood pressure of 20-
30 mm. Hg, followed by temporary rebound which ends in a
slow, progressive decline. The initial depression is accom-
panied by an inhibition of respiration. The initial depres-
sion and respiratory arrest are of reflex nature by stimulation
of the interoceptors in the left side of the heart and in the
glomus caroticum. The temporary elevation is the result
of vasoconstriction by sympathetic stimulation. The ter-
minal decrease in blood pressure is caused by a weakening of
the vascular tonus, produced by a direct action of the ester
on the vascular muscles. A. E. Meyer.

AUTHORS: Štěpán, Jaromír, Válka, Oldřich

TITLE: Determination of point coordinates by transformation

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 11, 1962, 30, abstract 11G214 ("Geod. a kartogr. obzor", 1962, v. 8, no. 6, 107 - 112, Czech)

TEXT: If the extension of a control network is conducted on the basis of two known points, the coordinates of the points being determined are calculated by the formulae:

$$Y = ay_r + bx_r + Y_o,$$

$$X = ax_r - by_r + X_o,$$

where

$$a = \frac{Y_r y_r + X_r x_r}{y_r^2 + x_r^2}, \quad b = \frac{Y_r x_r - X_r y_r}{y_r^2 + x_r^2}, \quad Y_r = Y - Y_o,$$

Card 1/4

Determination of point coordinates by transformation

S/035/62/000/011/075/079
A001/A101

$$X_r = X - X_o, \quad y_r = y - y_o, \quad x_r = x - x_o,$$

$$Y_o = 1/2 (Y_1 + Y_2), \quad X_o = 1/2 (X_1 + X_2),$$

$$y_o = 1/2 (y_1 + y_2), \quad x_o = 1/2 (x_1 + x_2):$$

Quantities Y_r, X_r, y_r, x_r are coordinates reduced to the common origin of the main and auxiliary systems (Y_o, X_o, y_o, x_o) . The following formulae serve as a control:

$$[Y] = a [y_r] + b [x_r] + n \cdot Y_o,$$

$$[X] = a [x_r] - b [y_r] + n \cdot X_o,$$

where n is number of transformed points. This method can be applied also for the solution of the Hansen problem. In determining coordinates of the points of a triangle chain from coordinates of the two given points, the rms error in position

Card 2/4

S/035/62/000/011/075/079

Determination of point coordinates by transformation A001/A101

of vertices of the first triangle is calculated by the formula:

$$m_{xy} = \pm S \frac{m_{\alpha}''}{\rho''},$$

where S is distance between the known point and that being determined, m_{α} is rms error in angle measurement, ρ is radian. The rms errors in positions of vertices of the subsequent triangles are equal to $M_{yx} = m_{yx} \sqrt{n}$, where n is the ordinal number of triangle. If there are more than two known points, transformation coefficients are calculated by the formulae: .

$$\alpha = \frac{[(Y_r - y_r) \cdot x_r] - [(X_r - x_r) \cdot y_r]}{[x_r^2] + [y_r^2]},$$

$$\beta = \frac{[(Y_r - y_r) \cdot y_r] + [(X_r - x_r) \cdot x_r]}{[x_r^2] + [y_r^2]}.$$

Card 3/4

Determination of point coordinates by transformation S/035/62/000/011/075/079
A001/A101

The following formulae are recommended for calculating coordinates:

$$y'_{i+1} = y'_i + (1 + \beta) \cdot \Delta y_{i, (i+1)} + \alpha \Delta x_{i, (i+1)},$$

$$x'_{i+1} = x'_i + (1 + \beta) \Delta x_{i, (i+1)} - \alpha \Delta y_{i, (i+1)}.$$

It is noted that the application of the proposed method for calculating coordinates of points being determined, reduces the number of measurements at expense of some increase of calculations, which is not burdensome at the present state of calculation technique. There are 6 references.

TITLE: Miniaturized profile manometers 10

SOURCE: Meres es automatika, no. 2, 1966, 63

TOPIC TAGS: manometer, pressure measuring instrument

ABSTRACT: The profile manometers developed at Mechanical Measuring Instrument Works were described. They comply with the stipulations of Hungarian Standards MSZ 11 201 and 11 202, and are capable of being operated in corrosive atmospheres. The dimensions of the instruments are 160 x 40 or 80 x 20 mm.; they are based on a Bourdon tube made of properly fatigued and heat-treated tombac. The instruments are of the conventional type except that they contained no geared arc or geared rod. The faceplate is circular, perpendicular to the rotational plane of the needle indicator. A specification and performance list is provided to indicate the operation of the instruments and the ranges in which they are available. Orig. art. has: 1 figure and 1 table. [JPRS: 35,328]

52. Measuring bridges for calibration - *Hitelesítő mérőhidak* - L. Stépan. (Measuring and Automatic Control - *Mérés és Automatika* - Vol. 1, 1953, No. 12, pp. 314-320, 15 figs.)

After a short survey of the layout and accuracy of measuring equipment such as the well-known a-c potentiometers, they are dealt with according to their principles of operation. These include equipment with phase shifting and others with complex compensation. The apparatus described at the end of the article, built at the Technical University at Budapest, operates on the principle of complex compensation. In designing the measuring equipment the given sensitivity of the zero indicating galvanometer and the prescribed accuracy of measurements had to be taken into account. For the calibration of current transformers the tensions proportionate to the primary and secondary currents are established by standard current transformers, and those for the calibration of potential transformers by means of standard voltage transformers. One of the standard measuring transformers furnishes the tension for determining the ratio error while the other
